

Global Conflict

Overview

Global Conflict is a massive multiplayer game in which each player has a home city, and clicking boosts the population of that city. Cities get bigger over time. Players can earn missiles and fire them at other cities to reduce population. Make your city the biggest on Earth.

The visualization is a 3d Earth sphere. Earth can be rotated by the player. Any city can be selected to see its current status, in terms of size and missile inventory. There is a simple single-button interface by which the player grows his city.

The game is browser-based and can be accessed via a weblink.

Game modes

There are three different modes in which players can view the game.

Spectator mode

This is what anyone who visits the site will see. They are not logged in. They can see global data. They can spin the globe and click on cities to view the individual city data.

The big button is purposed as a Login/Signin button. It has a tooltip explaining the interactions available once signed in.

Builder mode

This is the player mode available to non-paying players when they are logged in. The player will have a home city, which is centred and selected by default when the player logs in. Builders will see global data, city data for the selected city, and their own player data.

The big button is purposed as a Grow button. When it is pressed, it will add one to the city's population.

Achievement missile:

Builders will be able to earn and fire missiles at other cities by completing achievements. Only one missile can be held at a time. If an achievement is earned while a missile remains unfired, it is ignored.

Warrior mode

This is the player mode available to paying players when they are logged in. The player will have a home city, which is centred and selected by default when the player logs in. Citizens will see global data, city data for the selected city, and their own player data.

The big button is purposed as a Grow button. When it is pressed, it will add a multiple of one to the city's population (according to the click multiplier for playing players, initially test at two).

Warriors will be able to hold 2 unfired missiles at one time:

Achievement missile:

This is the same as for Builders, earned with achievements.

Click missile:

This missile is earned with a certain number of clicks. It can be fired immediately or it can be kept and automatically upgraded in range and damage by further clicks. Firing the missile resets the missile click count to zero.

Data types

There are three different data types which are generated and displayed in the game.

Global data

This is data that is generated by the whole planet. Examples [here](#). Visible to all users.

City data

This is generated for any city. Examples [here](#). Visible to all users for the city they have selected. All viewers should always have one city selected.

Player data

This is generated for individual players. Examples [here](#). It is visible only to individual builders and warriors, and only when they are signed in.

Achievements

Achievements are a way for both Builders and Warriors to earn achievement missiles. They track regular progress, but they do not need to be stored. Once an achievement is earned, the missile is awarded and that's it. If an achievement is earned while a missile remains unfired, then the old missile is discarded and the new missile takes its place.

When a player earns an achievement missile, the type of missile is randomly selected, to create some surprise for the player. The list of missiles is [here](#).

There are two kinds of achievements:

Cumulative achievements

These are simply a counter of clicks by the player. The first couple of achievements are given quite quickly, to get the player into the flow. After that, achievements are given in a regular pattern.

Timed achievements

These are timed challenges. The player has to compete against his own click count to earn missiles. There are two times: 10s and 1 day. The daily timer resets every 24 hours. The 10s timer resets after a small cooldown. Each time the player breaks their previous best, they earn the timed achievement and a new random missile.

Whenever a player pays for a new subscription, their best times are reset, so it is easier for them to earn the achievements again.

Achievements are defined [here](#).

Missiles

Missiles are fired contextually as you browse cities on the globe. When you select a city that you want to target, that is within range of one of your current missiles, you will be given the option to fire. If you fire, the missile will hit that city and the population will be reduced.

Missiles have two important characteristics:

Range

This dictates the range of the missile in kilometres from your home city. There are three different ranges of missiles.

Damage

This dictates the number of people killed by the missile. The casualty number is a randomly-generated number between 2 ranges. There are three categories of damage for missiles.

Only one missile of each type can be held at any time. Range and damage values are defined [here](#).

Subscription model

The game runs on a subscription model. By paying the subscription fee, the player is promoted from a builder to a warrior.

The advantages of subscription are:

- A click multiplier is applied, so a payer's click is worth a multiple of the clicks of a non-payer.
- Click missiles: every click counts towards earning a click missile which can be upgraded to have higher range and damage. This means a payer can store up to 2 missiles instead of 1.
- The most powerful missiles are only available as click missiles.
- Each time a subscription is bought or renewed, the payer's timers are reset for the timed achievements.
